

ICT272 Web Design and Development Tutorial 8

Topic: Designing Forms and HTML

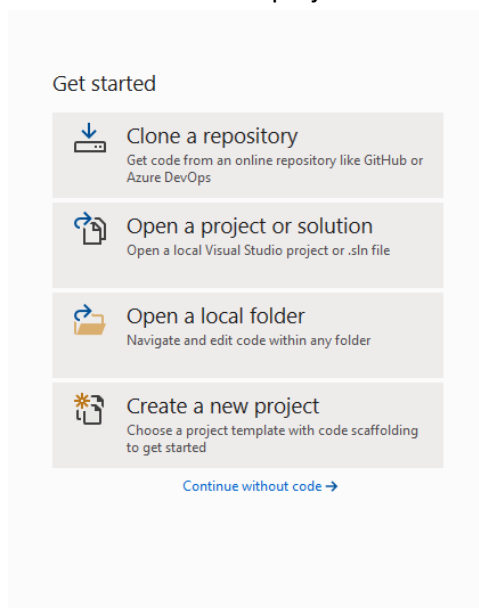

Submission: Submit to Moodle link (Week8)

Exercise 1 – Answer the following questions:

- Explain the purpose of 2 HTML form attributes ACTION and METHOD.
- Explain the difference between GET and POST method.
- List some of the most common HTML form controls?

Exercise 2: Create an MVC application to store/display restaurants and their reviews.

1. Start your visual studio 2019
2. Click on Create a new project.

3. Search for “Web Application” in search box and select “**ASP.NET Web Application (.NET Framework)**” with **C#** and then click Next.

Web Application ✕ ▼ Clear all

C# ▼ All platforms ▼ Web ▼

 ASP.NET **Web Application** (.NET Framework)
Project templates for creating ASP.NET **applications**. You can create ASP.NET **Web** Forms, MVC, or **Web** API **applications** and add many other features in ASP.NET.

C# Windows Cloud **Web**

- Name your project “**Week9tut**” and click on Create.

Configure your new project

ASP.NET Web Application (.NET Framework) C# Windows Cloud Web

Project name

Week9tut

Location

C:\Users\Admin\source\repos ...

Solution

Create new solution ▼

Solution name i

Week9tut

☐ Place solution and project in the same directory

Framework

.NET Framework 4.7.2 ▼

- Create **Restaurants.cs** model class as below and use scaffolding to create views and entity framework and database.

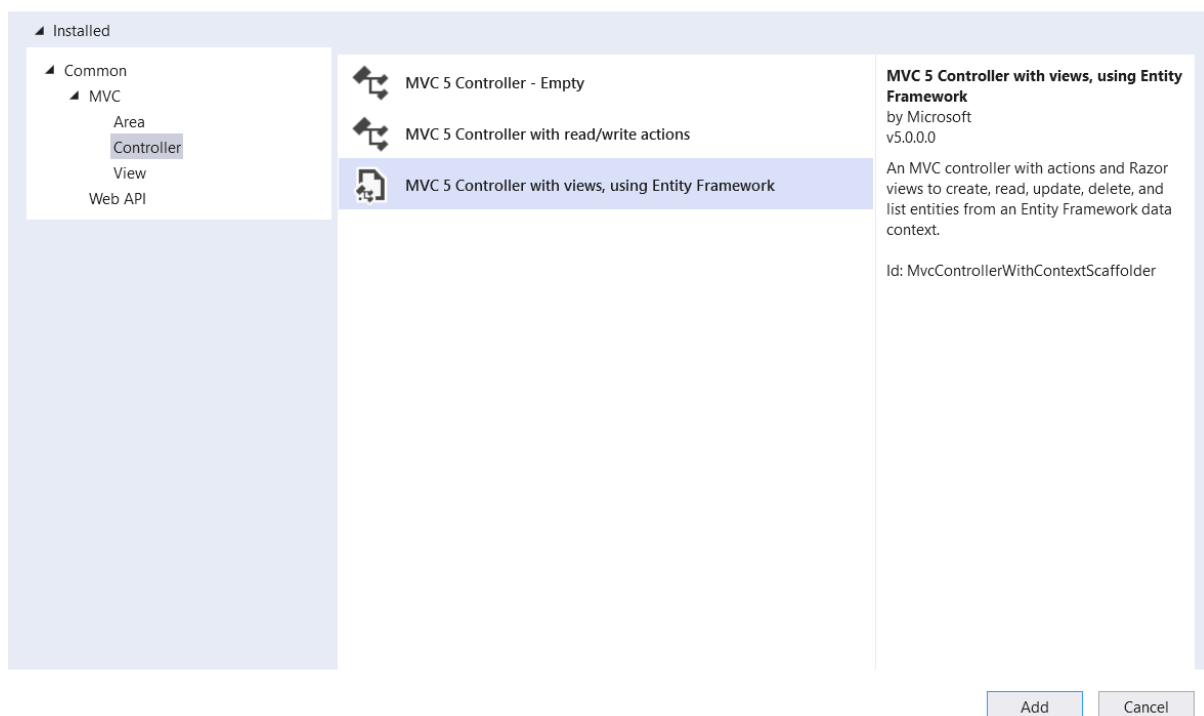

```
public class Restaurants{

    public int Id{get;set;}
    public string restaurantName {get;set;}
    public string restaurantReview {get;set;}

}
```

- Right click on Controllers and choose **"MVC5 Controller with views using Entity Framework"**

Add New Scaffolded Item

- Choose the model class, Data context class and Controller name.

Add Controller

Model class:

Data context class:

☐ Use async controller actions

Views:

☒ Generate views

☐ Reference script libraries

☒ Use a layout page:

(Leave empty if it is set in a Razor _viewstart file)

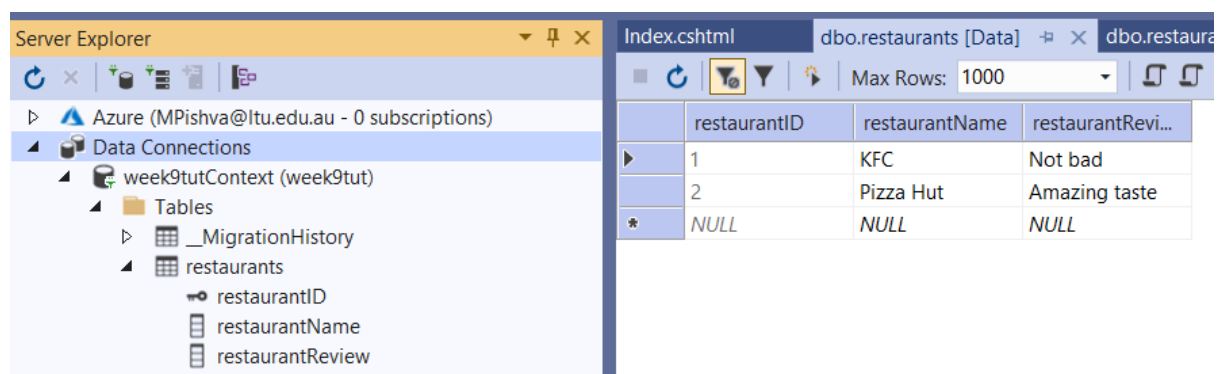

Controller name:

8. Now run the application by loading <https://localhost:44355/restaurants/> and add some data into the database using **Create New** link:

Create New

restaurantName	restaurantReview	
KFC	Not bad	Edit Details Delete
Pizza Hut	Amazing taste	Edit Details Delete

9. You should be able to see the associated entries in your database under **Server Explorer > Week9tutContext > Tables**, then right-click on **Restaurants** and click on **Show Table Data**

The screenshot shows the SQL Server Enterprise Manager interface. On the left, the 'Server Explorer' pane displays the 'Data Connections' tree with 'week9tutContext (week9tut)' expanded, showing the 'restaurants' table. On the right, the 'dbo.restaurants [Data]' table is selected, and the 'Show Table Data' window is open, displaying the following data:

restaurantID	restaurantName	restaurantRevi...
1	KFC	Not bad
2	Pizza Hut	Amazing taste
NULL	NULL	NULL

What to submit:

- The source code of Program files
- Screenshots of the output

Exercise 3: Design a Search tool for Restaurants.

- In the Restaurants application which you previously created, add a search box in **Index.cshtml**

```
<form action="/restaurants/Search" method="get">
  <label>Search restaurants by name</label>
  <input type="text" name="resname" />
  <input type="submit" value="Search" />
</form>
```

- Add a Search action method in Restaurants controller to connect to model and search the database.

```
//search action
0 references
public ActionResult Search(string resname)
{
    var resresult = db.restaurants
        .Where(r => r.restaurantName.Contains(resname));
    return View(resresult);
}
```

- Add Search.cshtml to display the Restaurants results.

```
@{
    ViewBag.Title = "Search";
}

<h2>Search</h2>

@model IEnumerable<week9tut.Models.restaurant>

<h2>Restaurant Reviews</h2>
<table border="1">
    <tr>
        <td>Name</td>
        <td>Review</td>
    </tr>
    @foreach (var item in Model)
    {
        <tr>
            <td>@item.restaurantName</td>
            <td>@item.restaurantReview</td>
        </tr>
    }
</table>
```

- Now run your application to search for a restaurant and test the output.

localhost:44355/restaurants/Search?resname=kf

Application name Home About Contact

Search

Restaurant Reviews

Name	Review
KFC	Not bad

What to submit:

- a. The source code of program files
- b. The output of the program

Exercise 4: Work on your group assignment

END of Tutorial
